SmartHire GenAI — Final Project Report

1. Project Overview

SmartHire GenAI is a career portal that extracts a structured resume profile, finds semantically matching jobs, generates CV improvement suggestions, and provides a RAG-based AI Career Mentor.

2. Technologies

Python, OpenAI API, embeddings, FAISS, LangChain, Streamlit, PDF/DOCX document loading, guardrails, Git/GitHub and deployment.

3. Core Flow

Resume upload → document loading and chunking → structured LLM profile → embedding-based FAISS search → CV suggestions / RAG Career Mentor → Streamlit portal.

4. Evaluation

Evaluation should measure retrieval relevance, answer correctness and grounding, prompt improvement, and refusal when information is not available.

5. Limitations

The included job corpus is a small starter dataset for testing. The final project should replace it with the permitted pre-collected Kaggle job dataset specified by the instructor.
